PKPD knowledge of HIPEC treatments is critical to select dosing regimens that maximize efficacy & minimize toxicity

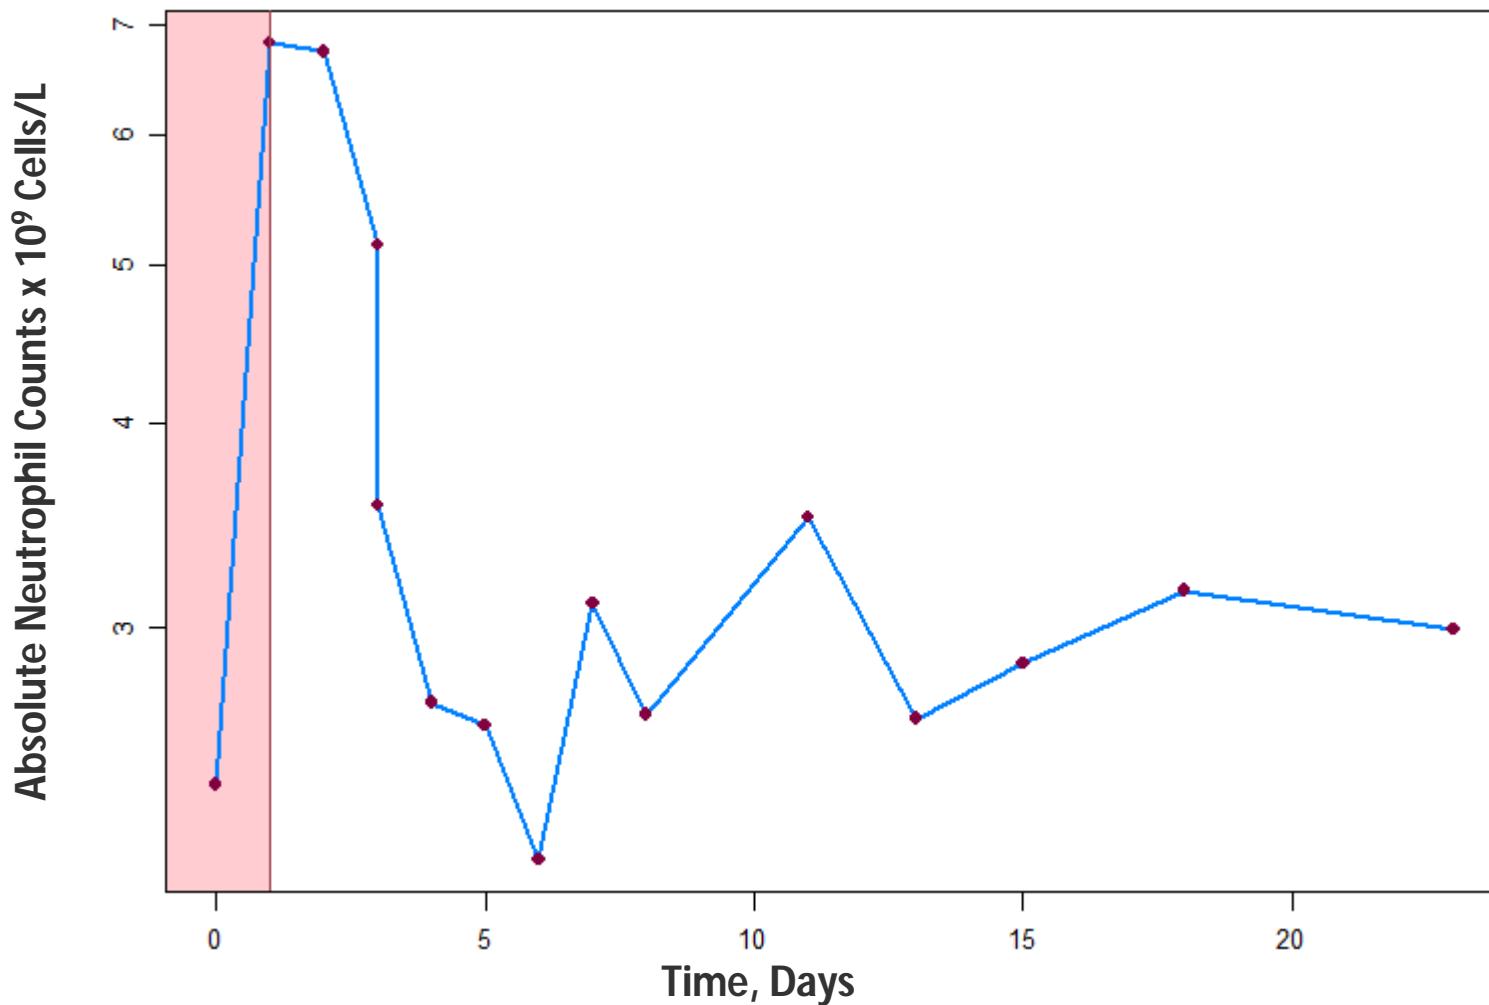

Research Article

Pharmacokinetic and Pharmacodynamic Analysis of Hyperthermic Intraperitoneal Oxaliplatin-Induced Neutropenia in Subjects with Peritoneal Carcinomatosis

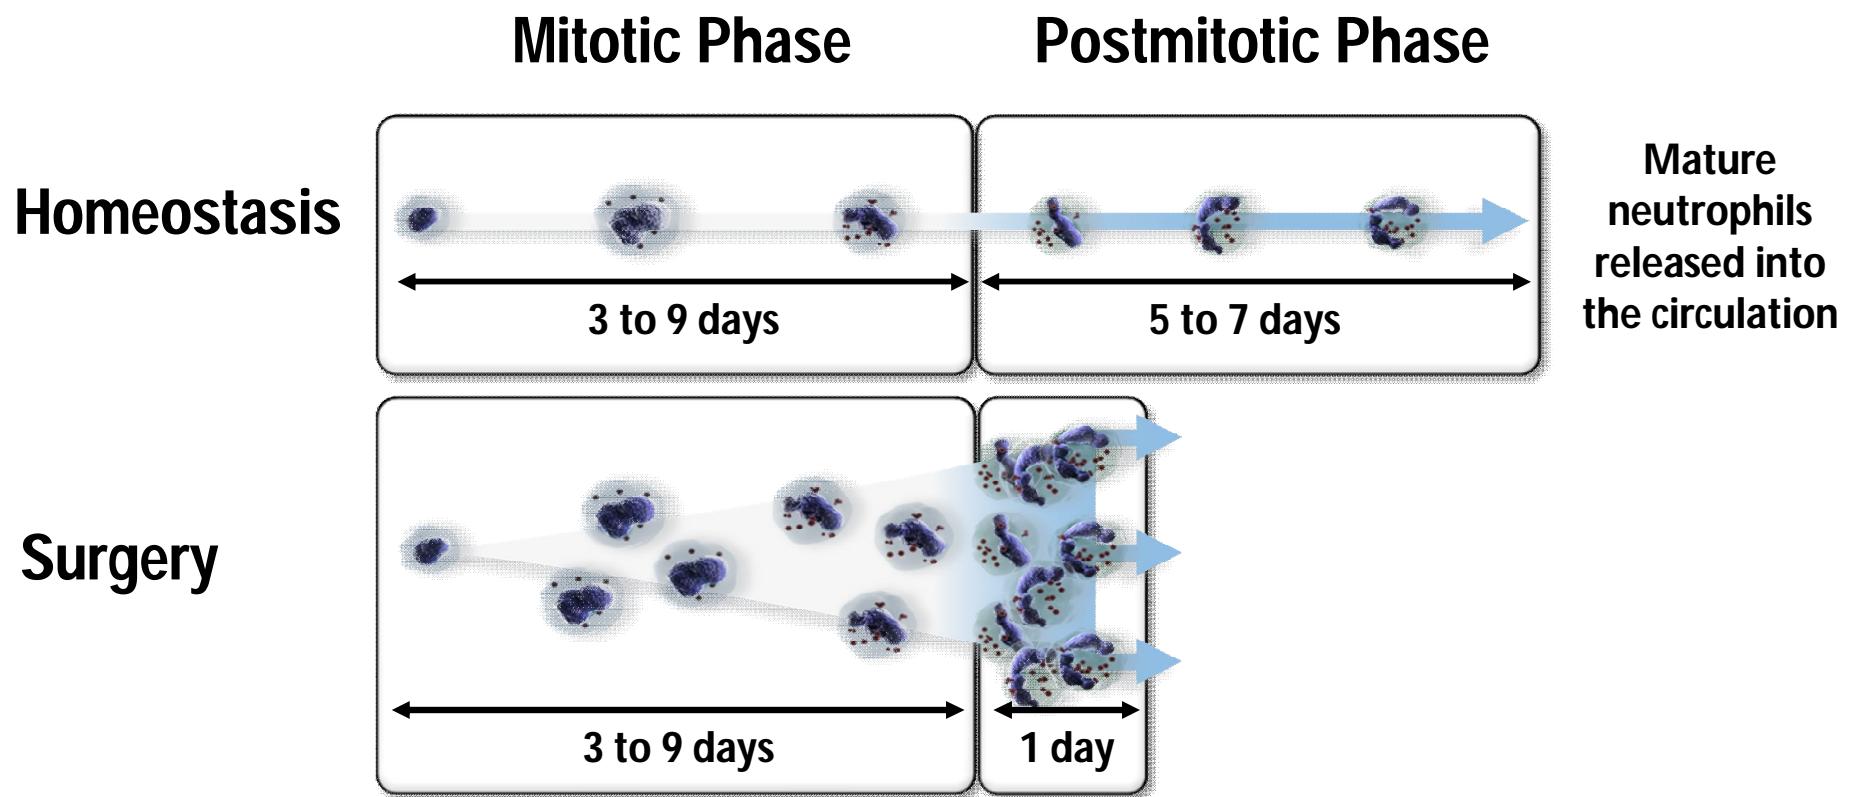

Belén Valenzuela,^{1,4} Ricardo Nalda-Molina,² Pere Bretcha-Boix,¹ Vanesa Escudero-Ortíz,¹ María José Duart,² Vicente Carbonell,³ Manuel Sureda,¹ José Pascual Rebollo,¹ Josep Farré,¹ Antonio Brugarolas,¹ and Juan José Pérez-Ruixo²

- Oxaliplatin maximum tolerated exposure in peritoneum is 240 mg·h/L and exposures >120 mg·h/L require G-CSF support.
- Absolute neutrophil counts after CRS & oxaliplatin potency to induced neutropenia were higher than expected

Time course of ANC following CRS + HIPEC

Surgery effect on granulopoiesis

Study Design

Cohort A

Cytoreductive Surgery
HIPEC Oxaliplatin (Icodextrin 4%)

Cohort B

Cytoreductive Surgery
HIPEC Oxaliplatin (Dextrose 5%)

Cohort C

Cytoreductive Surgery

Neutrophil dynamics model for HIPEC

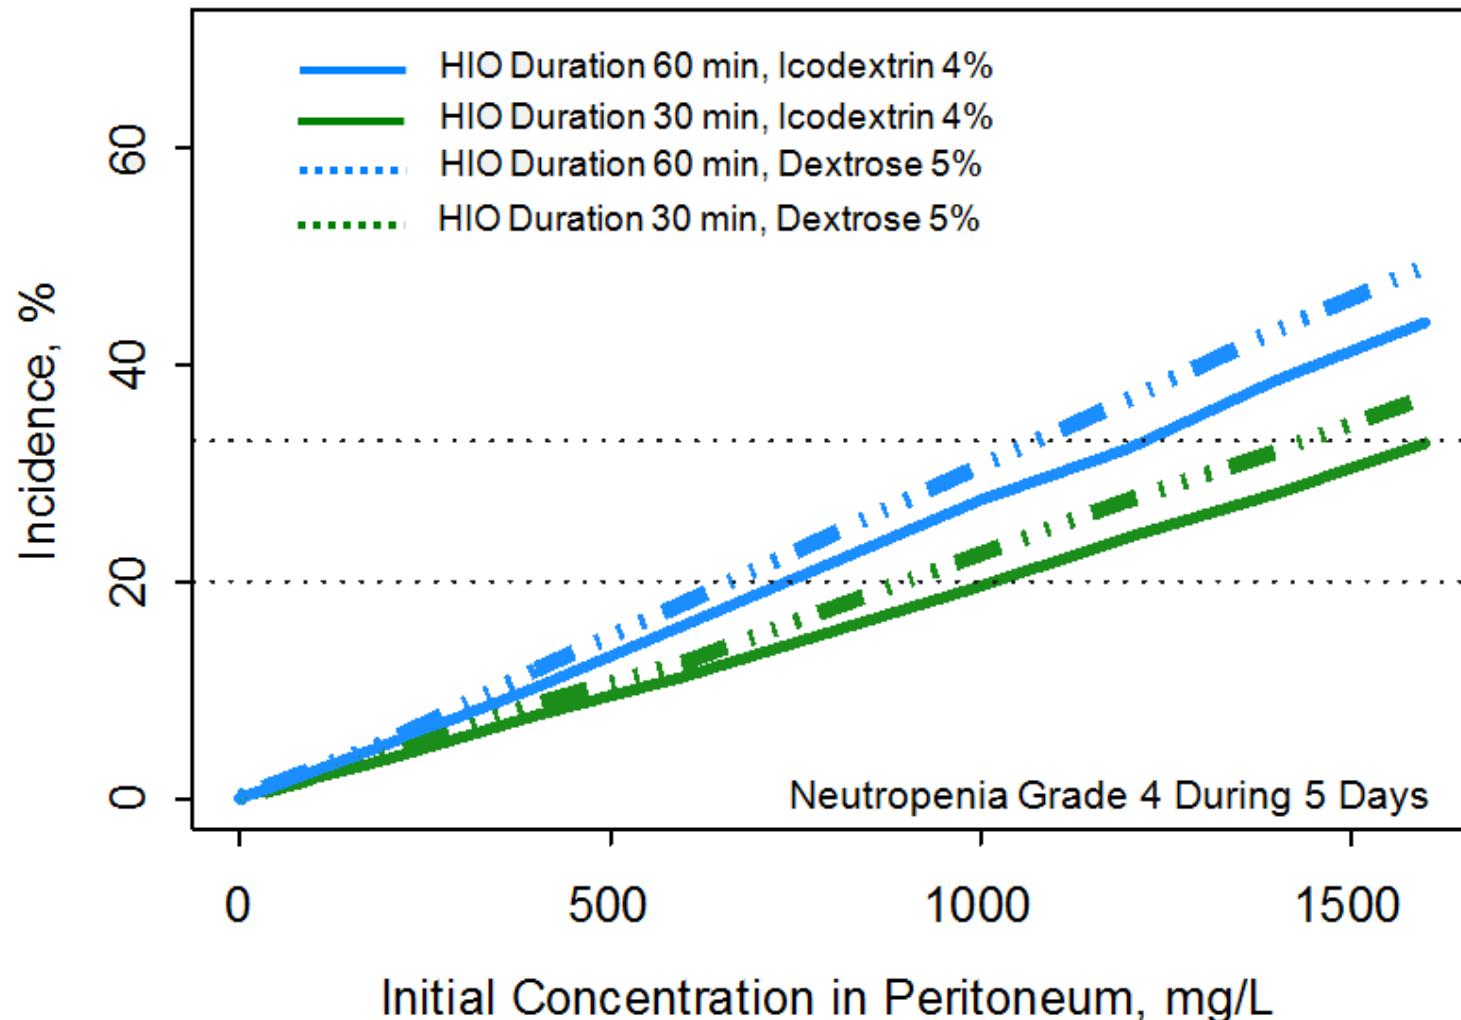

Neutrophil dynamics model predictions

Effect of surgery, oxaliplatin dose and vehicle on the ANC time course

What's the maximum tolerated exposure of oxaliplatin in HIPEC?

Conclusions

- PKPD knowledge of HIPEC treatments is critical to select dosing regimens that maximize efficacy & minimize toxicity.
- Cytoreductive surgery affect the neutrophil dynamics by stimulating the proliferation of precursor cells and reducing the maturation time
- Although several Ph1 clinical studies have established the oxaliplatin MTD, our exposure response analysis indicates that higher doses or extended duration might be feasible and should be tested in the context of clinical studies.
